

Quick-start guide for running the cacao-model under Windows 7

This quick-start guide contains step-by-step instructions on how to install the cacao-model and the software needed to run it. It is a replacement for Chapter 2 in the CASE2 User's manual. The required software includes FSE Windows 1.08 and the Compaq Visual Fortran 6.6 compiler. The installation file for FSE is provided with this distribution and this document contains instructions on obtaining a copy of CVF6.6.

1. The distribution of the cacao-model (Cocoa.zip) contains a number of elements:
 - a. The file **case2.zip**
 - i. This zip-file contains the model itself (including the source code), data files that are needed to run the model and background information on the model, including the user's manual.
 - b. The file **fstfsewin_setup.zip**
 - i. This zip-file contains the setup file for the FSE-software.
2. The first step to take after downloading the main zip-file (Cocoa.zip) is to unzip this file and follow the subsequent steps outlined below.
3. Unzip fstfsewin_setup.zip and use FSTFSEWin_Setup.exe to install FSTFSEWin.
 - a. During the installation choose to install into a different directory than the default. The default setting is to install to c:\program files, but this can cause problems with access permission. It is, therefore, better to install to a different folder (e.g. c:\FST\).
4. Download and install Compaq Visual Fortran (CVF) 6.6
 - a. A zip-file named CVF66.zip can be downloaded from:
<http://models.pps.wur.nl/content/visual-fortran-compiler-vfc-0>
 - b. This zip-file contains a number of items:
 - i. A disc image file for Compaq Visual Fortran (Compaq_V_Fortran_6.6.iso)
 - ii. A zip file (CVF-66A.zip) containing an update of CVF to version 6.6a (CVF-66A.exe)
 - iii. A zip file containing software to make an installation CD from the disc image file (SetupImgBurn_2.5.0.0.zip)
 - c. Install CVF following the [instructions below](#) and using the license code: 33106-064-2674992-00003.
5. Unzip case2.zip to c:\case2\
 - a. Since the model code contains some absolute file paths it is necessary that all folders are unpacked to the right location, i.e.:
 - C:\case2\document
 - C:\case2\program
 - C:\case2\source
 - C:\case2\weather
6. When FSTFSEWin has been successfully installed you can start FSEWin and open the file case2.fpf in the folder c:\case2\program, using the option "Open Project" in the file-menu.
7. The model can now be run and configured according to the instructions in the CASE2 user's manual in c:\case2\document (from page 15 onwards).

Compaq Visual Fortran 6.6 installation guide

1. Burn the disc image file (Compaq_V_Fortran_6.6.iso) to a CD or mount the disc image using a tool like Daemon Tools Lite (<http://www.daemon-tools.cc/eng/products/dtLite>)
2. Start the setup from the CD or the emulated drive. The setup.exe in the root-folder of the CD will probably not work and give an error message. In the X86-folder on the CD there is another setup.exe, however, that will install CVF 6.6. When the installation program is started follow these steps:
 - a. On the question view the read.txt file select NO and press the Next button.
 - b. Accept the license terms, press Next.
 - c. Enter the serial number (33106 064 2674992-00003) and press Next, than YES.
 - d. Select the TYPICAL setup install type and press the Next button twice.
 - e. On the question 'Do you want Setup to set Developer Studio as your Just in Time Debugger?' answer NO.
 - f. On the question 'Do you want Setup to update your Environment Variables?' answer YES.
 - g. On the question 'Do you want to register now?' answer NO (**NEVER** DO REGISTER!), next press the OK button.
 - h. On the question 'Do you want to install Compaq Array Visualizer Viewer?' answer NO.
 - i. Now press Finish to end the installation and reboot your PC to finalize the setup.
3. After the installation of CVF has finished update to version 6.6a using the update-file provided (CVF-66A.exe). This file can be executed from your PC directly and does not need to be burned to a disc.
